

1. What is the Difference Between Dimension and Measure?

In Tableau, data fields are categorized as **Dimensions** and **Measures**.

Dimension	Measure
Qualitative data	Quantitative data
Used to categorize and segment data	Used to perform calculations and analysis
Usually contains text, dates, or categories	Usually contains numbers
Creates headers, rows, and columns	Creates axes and aggregated values
Cannot typically be summed or averaged	Can be summed, averaged, counted, etc.

Examples:

Dimensions:

- Patient Name
- Department
- Gender
- City
- Admission Date

Measures:

- Revenue
- Patient Count
- Length of Stay
- Treatment Cost
- Bed Occupancy Rate

Example in Healthcare:

If you want to see the number of patients by department:

- **Department** = Dimension
- **Patient Count** = Measure

2. How to Change Data Type at Sheet Level or Data Pane in Tableau?

Ans:

Sometimes Tableau assigns an incorrect data type to a field. You can change it from the **Data Pane**.

Method 1: Change Data Type from Data Pane

1. Open Tableau and connect to your data source.
2. In the **Data Pane** (left side), locate the field.
3. Click the **data type icon** beside the field name (ABC, #, Calendar, Globe, etc.).
4. Select the desired data type:
 - String
 - Number (Whole)
 - Number (Decimal)
 - Date
 - Date & Time
 - Boolean
 - Geographic Role

Example:

If Patient ID is being treated as a Number but should be Text:

- Click the Number (#) icon.
- Select **String**.

Method 2: Change Data Type from Data Source Page

1. Go to the **Data Source** tab.
2. Locate the column whose data type you want to change.
3. Click the data type icon above the column.
4. Select the appropriate data type.

Common Data Type Icons in Tableau

Icon	Data Type
ABC	String
#	Number
Calendar	Date
Calendar + Clock	Date & Time
T/F	Boolean
Globe	Geographic Data
